Salon Open / Closed Label — Timing API

How the public app shows **Open** / **Closed** on shop page & Nearby. Backend must send correct **timing** so labels work.

1. What the app shows

On salon / shop detail page (and Nearby list cards):

- **Badge** (top of hero): green **Open** or grey **Closed**
- **Hours line**: *Open until 9:00 PM* or *Closed · Opens at 10:00 AM*

Important: *The public app does **not** require a separate Open/Closed API flag on the shop page. It calculates status from the salon **timing** array + the **device local clock**.*

2. APIs that must return timing

Send a **timing** field on these responses:

- `api/v1/salon/salonDetails` — shop page
- `api/v1/salon/getHomeData` — home salon list
- Nearby / search salon objects

3. Required timing format

Accept either a JSON array or a JSON string. Preferred: array.

```
"timing": [
  { "day": 0, "open_time": "10:00", "close_time": "21:00" },
  { "day": 1, "open_time": "10:00", "close_time": "21:00" },
  { "day": 2, "open_time": "10:00", "close_time": "21:00" },
  { "day": 3, "open_time": "10:00", "close_time": "21:00" },
  { "day": 4, "open_time": "10:00", "close_time": "21:00" },
  { "day": 5, "open_time": "10:00", "close_time": "21:00" },
  { "day": 6, "open_time": "10:00", "close_time": "21:00" }
]
```

Field	Type	Rule
`day`	int	**0 = Sunday, 1 = Monday … 6 = Saturday**
`open_time`	string	24-hour `HH:mm` e.g. `"10:00"` (not `"10:00 AM"`)
`close_time`	string	24-hour `HH:mm` e.g. `"21:00"`

Overnight hours (e.g. 20:00 → 02:00): `close_time` may be earlier than `open_time`. App adds 24 hours.

Closed all day: omit that day's row, or do not send times for that day.

4. Optional helper fields (Nearby fallback)

If `timing` is empty, Nearby may fall back to:

```
"is_open": true,
"open_now": 1
```

`true` / `"1"` = open. Shop detail page still prefers `timing`.

5. How the public app decides Open vs Closed

1. Pick today's day with Dart: `DateTime.now().weekday % 7`
   Monday=1 … Sunday=7 → Sunday becomes **0**.
2. Find the `timing` row where `day` matches today.
3. If no row for today → **Closed**.
4. If now is between `open_time` and `close_time` → **Open**.
5. Else → **Closed · Opens at {today open_time in 12-hour}**.

Example: today Saturday (`day: 6`), open 10:00, phone 7:07 AM → **Closed · Opens at 10:00 AM**. After 10:00 AM → **Open** / **Open until …**.

*Uses **device local time**, not salon timezone.*

6. Checklist for backend team

1. Always send a full 7-day timing array (or only open days).
2. Use day map 0–6 (Sunday=0). Do not use 1–7 Monday-first unless the app is changed.
3. Times must be `HH:mm` (24-hour), not `10:00 AM`.
4. Optional: also send `is_open` / `open_now` in sync with those hours for list screens.
5. If salon is closed today: omit that day — do not send `00:00–00:00` unless it means open midnight–midnight.
6. Keep partner/admin UI day map identical so saved hours match what the public app expects.
